

Hollow Man

Exploring the space counts

When it comes to whether government shall spend money on space exploration or on the welfare of humans, different people have different views. Some people are likely to think that it's totally a waste to spend money on useless rockets and satellites, but my opinions differ. As far as I'm concerned, exploring the space counts for human's future. My reasons are as follows.

To begin with, exploring the space contributes to the advance of technology, thus a better and more convenient life. For instance, disposable diaper is extremely common for young babies to use in today's society, nevertheless, diaper was designed for the astronauts to use in space originally, and we can't have it if NASA didn't launch its space programme, and so do the technology to make vegetable packs in instant noodles.

Moreover, space technology may count a lot in the future. Let's just imagine, provided that someday, because of humans' destruction, earth is no longer suitable for mankind to live, and migration is the only way to save the human race from extinction. How can we have the possibility to leave earth without powerful space rockets and shuttles? Therefore, developing space technology will help mankind a lot in the future.

In a nutshell, we shall spend money on solving the basic problems of society, but we can't just spend all money on it while set exploring the space aside. Space technology gives us a new way to define human itself and to think of our position in space. Space technology makes humans in the future filled with possibilities.
